

1 Amendments to the Claims:

2 This listing of claims will replace all prior versions, and
3 listings, of claims in the application using (Original) (Currently
4 Amended) (New) (Canceled) (Previously Presented) nomenclature, as
5 recited in the below listing of claims.

6
7 3. (Currently Amended) A communication system for broadcasting a
8 channel signal, the system comprising,

9 a detection receiver for receiving a channel signal having a
10 modulated carrier for communicating first messages using a first
11 spreading code and communicating second messages using a second
12 spreading code, the detection receiver comprising:

13 a first replica spreading code generator providing a first
14 replica spreading code;

15 a second replica spreading code generator providing a second
16 replica spreading code;

17 a first despreader for despreading the channel signal into a
18 first despread signal;

19 a second despreader for despreading the channel signal into a
20 second despread signal;

21 a first carrier demodulator for carrier demodulating the first
22 despread signal into first quadrature signals;

23 a second carrier demodulator for carrier demodulating the
24 second despread signal into second quadrature signals;

25 a first power detector for detecting the power level of the
26 first quadrature signal for providing a first power signal;

27 a second power detector for detecting the power level of the
28 second quadrature signal for providing a second power signal;

1 a comparator for determining which one of the first power
2 signal or the second power signal is present; and
3 a selector for selecting and providing the first quadrature
4 signal when the first power signal is present or for selecting and
5 providing the second quadrature signal when the second power signal
6 is present, the first quadrature signal communicating the first
7 message when the first power signal is present, the second
8 quadrature signal communicating the second message when the second
9 power signal is present,
10 the system further comprising,
11 a data source for providing the first message during a first
12 time period when the first power signal is present and for
13 providing the second message during a second time period when the
14 second power signal is present,
15 a code generator for generating an original first spreading
16 code and an original second spreading code,
17 a spreader for spectrum spreading the first message by the
18 original first spreading code and for spectrum spreading the second
19 message by the original second spreading code, the first replica
20 spreading code being a replica of the original first spreading
21 code, the second replica spreading code being a replica of the
22 original second spreading code, the first message and second
23 message are spectrum spread into first and second spread spectrum
24 signals,
25 a transmitter for broadcasting the channel signal by
26 modulating a carrier by the first spread spectrum signal during the
27 first time period and by the second spread spectrum signal during
28 the second time period, and

1 a first code receiver for receiving the first message during
2 the first time period, the transmitter system communicating to the
3 detection receiver and to the first code receiver during the first
4 time period, the transmitter system selectively communicating to
5 the detection receiver and not the first code receiver during the
6 second time period.

7
8 4. (Original) The system of claim 3 further comprising,
9 a plurality of detection receivers receiving the first and
10 second messages.

11
12 5. (Previously Presented) The system of claim 3 further comprising
13 a plurality of first code receivers for receiving the first
14 messages.

15
16 6. (Original) The system of claim 3 wherein,
17 the first and second codes are partially correlated.
